Operating Instructions 200MB/200RCB

The Basics

Your new G-K Bass amplifier represents the latest advances technology has to offer. With a built in limiter, chorus, 4 band EQ, two voicing filters and a master volume; the number of different sounds available is endless.

A careful examination of this manual will help you get the most from them.

LEFT TO RIGHT ON THE FRONT PANEL

Input Jack

The input jack is a standard $\frac{1}{4}$ " jack capable of handling a wide variety of signal levels up to 9v RMS.

Volume

This knob controls preamp volume and limiter threshold. This will control your overdrive sound or sustain when limiter is on.

Voicing Filters

The contour switch "rounds" out the tone by putting a dip in the midrange frequencies and boosting the bass and treble.

The high-boost switch boosts the high frequencies for a brighter sound. Also can be used to "liven" up old and worn strings.

4 Band EQ

1. The first knob is an active treble control operating at 4.0 kilohertz. It adds high end and brightness to your sound.
2. The second knob is an active high mid-range control operating at 1.0khz. This controls the punch and definition of your tone.
3. The third knob is an active low mid-range operating at 250hz. This adds to the meat or body of your sound.
4. The last EQ knob is an active bass control operating at 60hz. This controls the bottom end or boom of your sound.

Limiter

With the master up full the limiter will prevent the power amp from distorting.

With the master on lower settings, the limiter will give you smooth distortion free sustain, with the level controlled by the master setting. Raising the volume level increases sustain.

It is possible to drive the preamp into distortion by raising the volume control too high, even when the limiter is on.

Master

The master volume controls the total output from off to full power.

Chorus on/off

The chorus is a fully adjustable, studio quality effect unit built right into your amp. It incorporates a high technology IC chip to give a full chorus enhancement of your sound.

Phones

The phones jack is a $\frac{1}{4}$ " stereo jack. It delivers a stereo signal for use with high impedance head phones (600 ohm or greater). Plugging into the phones jack does not disconnect the speakers. To disconnect the speakers use the switch on the rear panel.

Effects Loop

The effects loop is provided for the insertion of external effects. It is post EQ and pre internal effects. Using standard guitar cords, connect the send of the amp to the input on the effect unit; connect the output of effect to the return on the amp. The level is 150 mv with master up full.

Direct Outs

Both wet and dry low impedance direct outs are provided with your amp for professional recording capabilities. The wet direct signal contains effects and is controlled by the master volume. The dry direct has no effects and is not affected by the master volume.

Internal Speaker on/off (200MB)

You have the ability to turn off the internal speaker with this switch.

External Speaker Jack

This jack is for use with an external speaker cabinet. With the internal speaker on, you can add an 8 ohm load. With the internal speaker off, you can add a 4 ohm load.

Power Switch

The power switch on the 200MB is on the rear panel. The power switch on the 200RCB is on the front panel lower right.

Power Cord

The power cord is detachable and plugs into a socket on the rear panel. If a replacement cord is used or needed it should be UL rated at 10 amp, 125v; or if using 240v, the cord should be UL rated at 5 amp, 240v.

Fuse

Never operate your MB or RCB with any other than the recommended fuse.

115v operation – type TSC2A

240v operation – type TSC1A

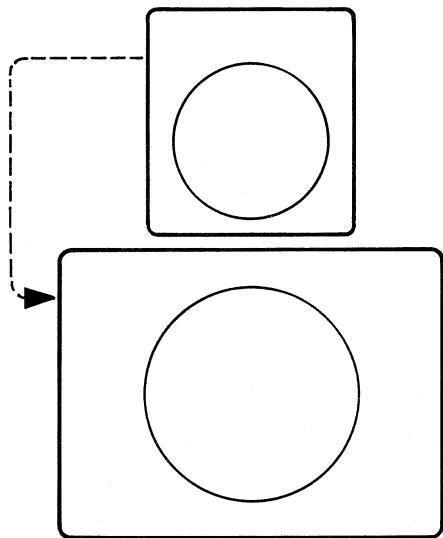

Maintenance

Your new amplifier is rugged. It was built to give you a lifetime of trouble free operation. If it is operated with care, your only maintenance problems should be cleaning. We recommend a soft damp cloth and mild soap for cleaning outside surfaces. Your amp can be serviced at any GK authorized service center or at the GK factory if needed.

200MB/RCB T/O Procedure

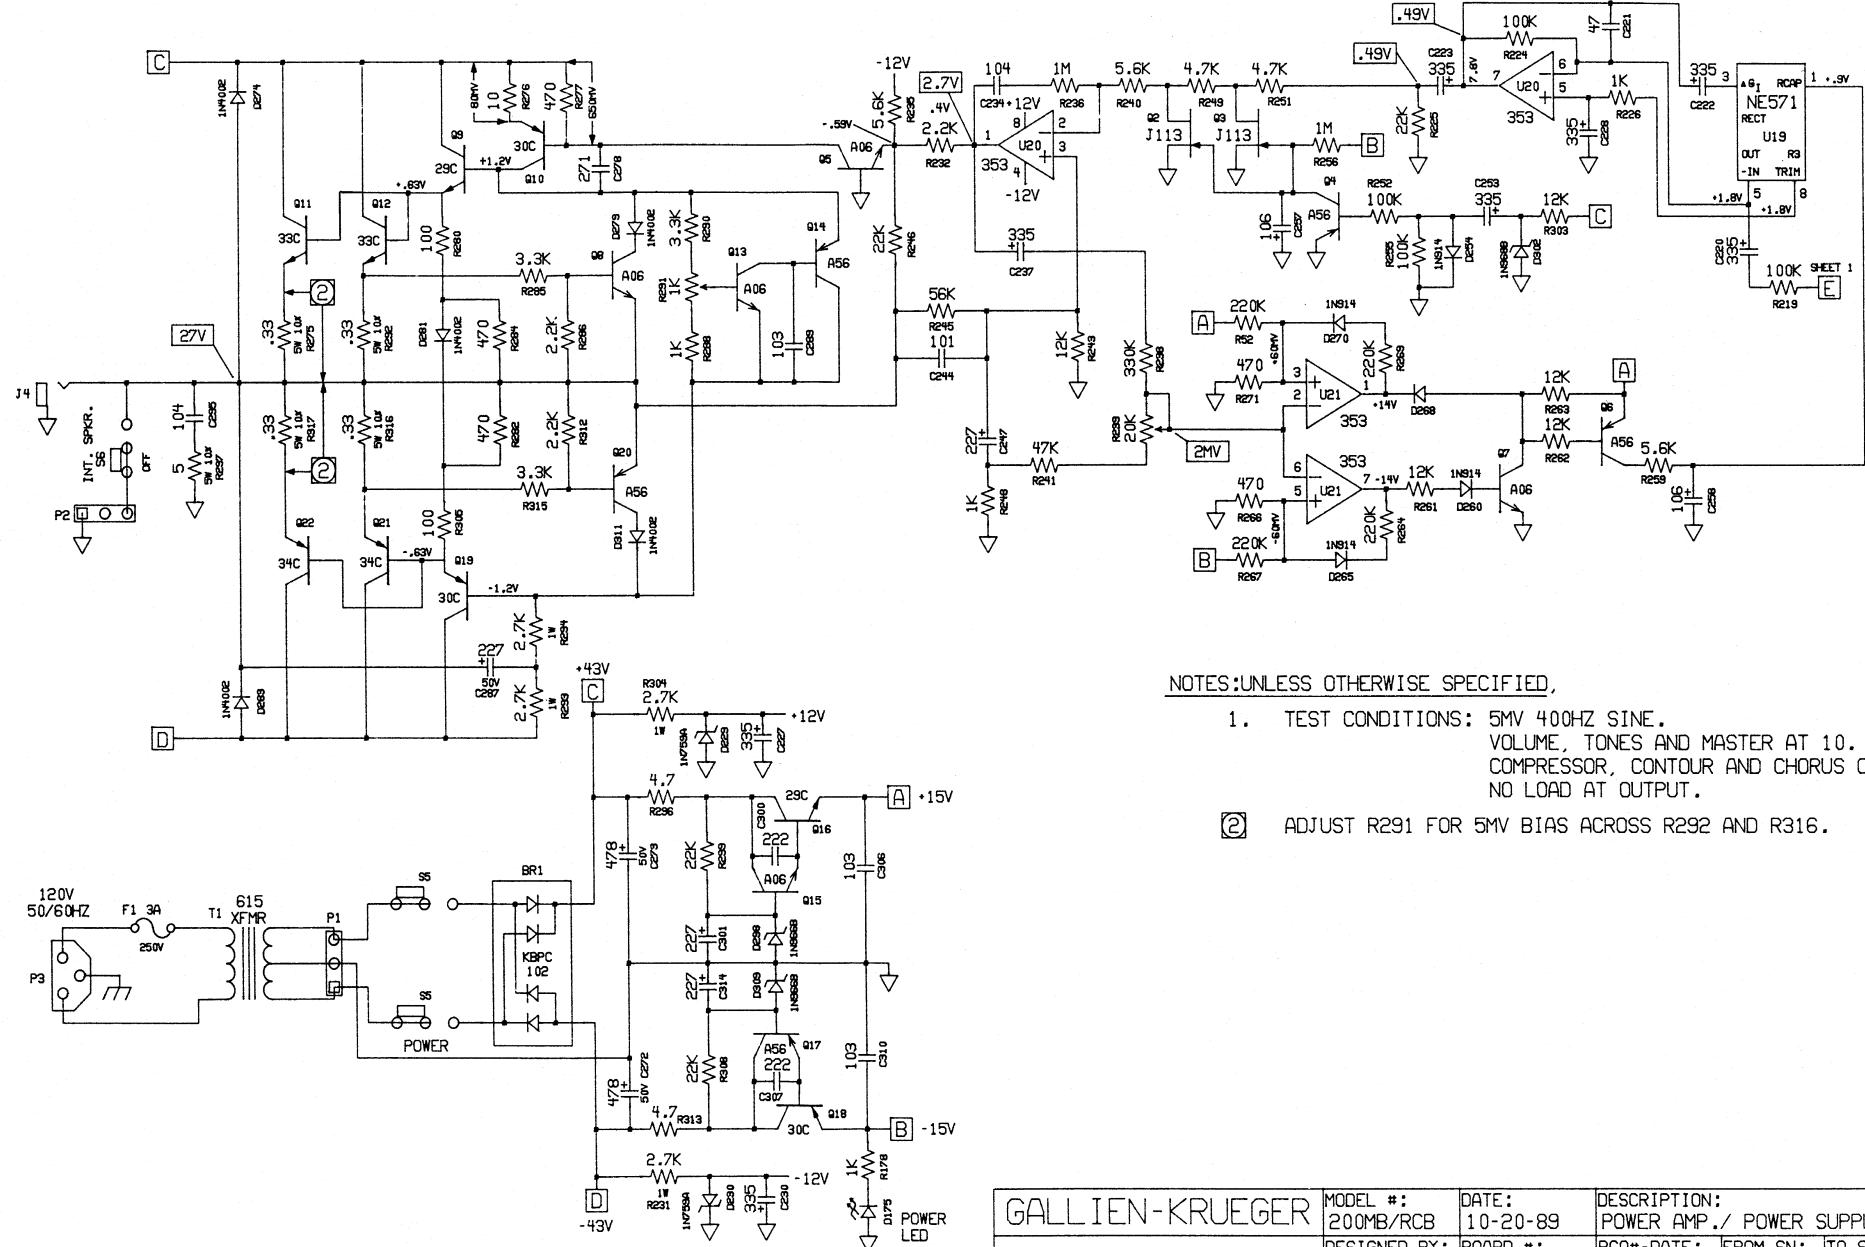

Rev.B- 3/7/88

- 1) Inspect board.
- 2) Connect mains.
- 3) Observe the following:
 - A) no load E) volume on 0 I) chorus depth on 0
 - B) variac at 0 F) master on 0 J) chorus rate on 0
 - C) trim pots halfway G) switches out K) speaker on
 - D) tones on 5 H) sustain on 0
- 4) Gradually adjust variac to 25 Vrms.
U20/P4= -1.5V (+or-) .5V. U20/P8= 3.2V (+or-) -.5V.
Regulated supplies = -.5 V (+or-) .5V./ 7.1V (+or-) -.5V.
- 5) Gradually adjust variac to 70Vrms while listening to the speaker and watching variac (AC amps) and scope. Output should go -8V then +10V, motor a little and settle at 0 between 50-60Vrms.
Regulated supplies = -14.3V (+or-) .5V/ 14.2V (+or-) .5V.
- 6) Adjust variac to 120Vrms and turn speaker off. Supply voltage (+or-) 46.5V (+or -).5V.
- 7) Set bias. Adjust R207 to get 5mV across R197, R208 (most pos. of the two), and R223, R224 (the most neg. of the two).
- 8) Set the following: master on 10.
- 9) Connect sine input (400Hz 50mVrms) -26 dB.
- 10) Compressor test.
 - A) Volume on 10.
 - B) Sustain on 0. U2/P6= 700mVp-p. U4/P7= 2.3Vp-p.
 - C) Engage compressor. U4/P7= 1.2Vp-p.
 - D) Gradually adjust sustain to 10. U4/P7 should increase to 1.7Vp-p.
 - E) Disengage compressor and continue.
- 11) Limiter adjustment. Adjust R174 to get a flat response at U21/P2 (compare fig.)
- 12) Set the following: volume on 0; 4 ohm load.
- 13) Slowly turn up volume just until limiter LED begins to light. At this point, output should be at full power =20Vrms.
- 14) Current limiter test. Change to a 2 ohm load. Output should be a clean sine wave without clipping and = 12Vrms (+or-) .5Vrms.
- 15) Turn master up and down to check if it works properly.
- 16) Set the following: volume and master on 10, no load.
- 17) Check direct out (J5) pins 2 and 3 = 550mVrms (1.5Vp-p).
- 18) Check balance out left (J8) and right (J9). Both should = 5.5Vrms in stereo and mono mode at pins 2 and 3.
- 19) Check send (J7). 1.7Vp-p, clean sine wave. Probe at R229.
- 20) Check headphone jack (J3). Tip = 3.4Vrms / Ring = 3.4Vrms or 13Vp-p clipped.
- 21) Test return.
 - A) Plug input into return (6). (400Hz 50mVrms sine) -26.0 dB. Output = 4Vrms.
 - B) Line out (J10)= 80mVrms.
- 22) Change to square signal at input (400Hz -26.0dB).
- 23) Test tones and filters and compare figures.
- 24) Chorus test.

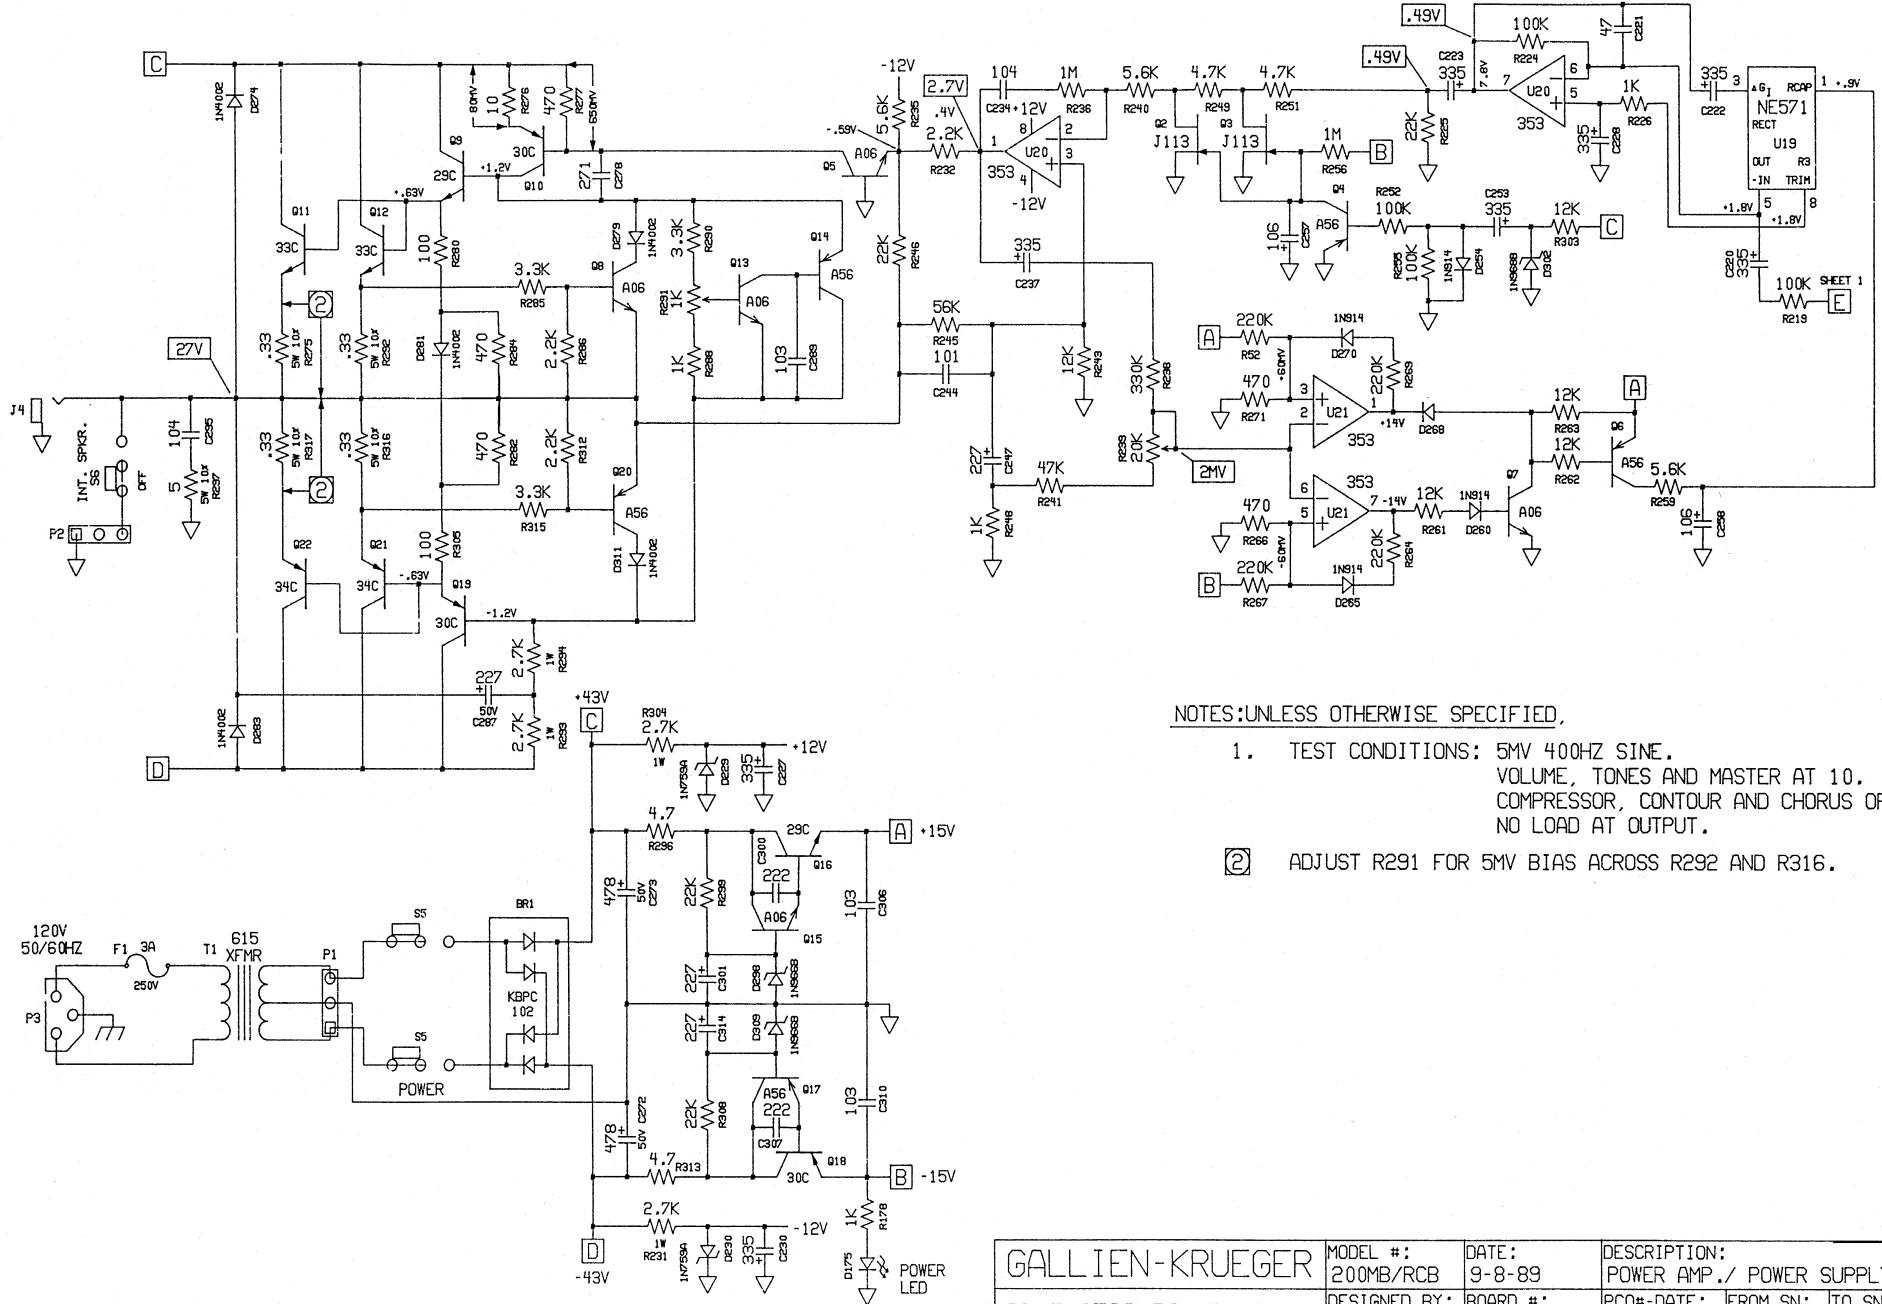

Note: Trigger is on the channel, the scope probe is on, and connect to D.0 (J5) @ 1V/div. This will make it possible to make measurements without having trigger problems. An external trigger could also be used.

- A) Volume at 9 o'clock
 - B) Master at 10.
 - C) Tones on 5.
 - D) Engage chorus.
 - E) Rate 0/ Depth 0. Deviation = 1.3 sec. / Rate = 1.5 sec.
 - F) Rate 0/ Depth 10. Deviation = 5.0 sec.
 - G) Rate 10/ Depth 10. Rate = .25 sec.
 - H) Disengage chorus.
- 25) Balance out test. Sine input (400Hz 50mVrms) -26.0dB.
- A) Volume on 5.
 - B) Master on 10.
 - C) Tones on 5. Balance out left pins 2 and 3 and balance out right pins should look different. Left should swell up and down to a min. and max. value. Right should do the same, however oscillate right and left.
 - D) Engage chorus.
 - E) Stereo switch out.
 - F) Push in stereo switch (mono mode). Signal on left and right should look similar, swelling up and down.
 - G) Chorus off.
- 26) Check speaker cut-off switch.
- 27) Disconnect input.
- 28) Proceed with noise and tap test.
- A) Controls on 10, switch out = noise <60mVrms.
 - B) Controls on 10, contour in = noise <80mVrms.
 - C) Controls on 10, comp. in, sustain 0 = noise < 50mVrms.
 - D) Controls on 10, comp. in, sustain 10 = noise < 250mVrms.
 - E) Controls on 10, comp. in, sustain 10 = noise < 300mVrms.
 - F) Contour in, chorus in = noise < 40mVrms.
 - G) Contour in, master on 0 = noise < 2.5mVrms.

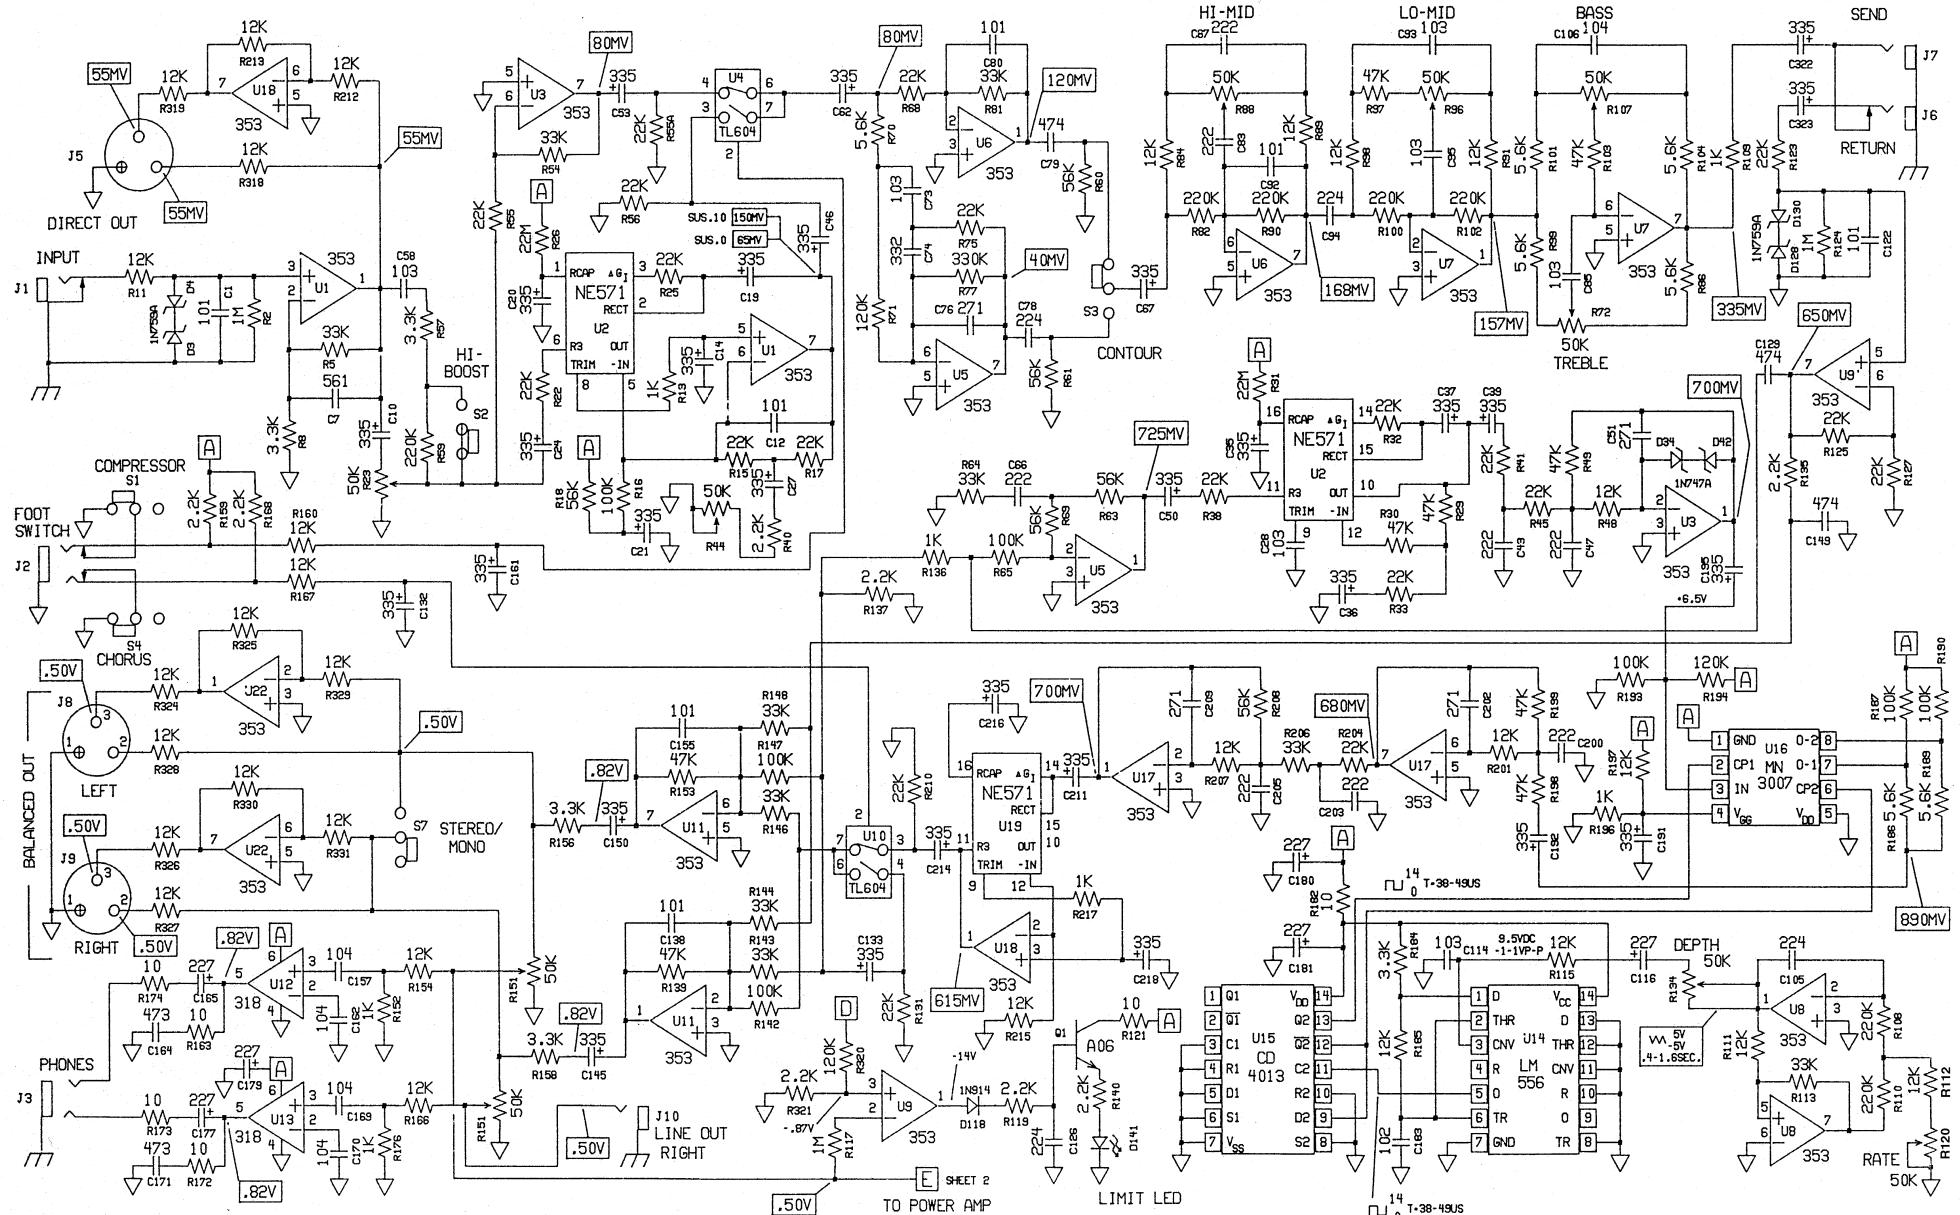

Noise should be clean without popping or cracking.
