

TR-2 Mods

- ✓ Change R9 from 10k to 4.7k or even 3.3k for more vol
 - C7 remove for a slight "high end" lift
- ✓ R31 is 50k and controls the speed of the trem, lower it to go faster baby!
- ✓ R19 is 10k, reducing this changes the waveform, so be careful...but its a fun thing to try.
 - I think the input resistor (R2) is 1m, but if its lower like a lot of Boss pedals such as 470k or 510k just up the value to 680k or so for better signal through the circuit, even when bypassed.
