

Notes:

1. Arrows indicate clockwise knob rotation.
2. These voltage readings were taken from my specific amp, these voltages will vary some from tube to tube, or even between triodes in the same tube as you can see here with V1.
3. At close to 400 volts on the plates those EL84's are working pretty hard, so I insert screen resistors on each.

Can substitute with Mercury Magnetics 2061X replacement output transformer: Toneclone O20JM-L.

If using the Mercury Magnetic 2061X replacement transformer, as you see here, the wiring code is slightly different, plus there are more primary voltage options.
