The information contained herein is CONFIDENTIAL and PROPRIETARY to Fender Musical Instruments Corp. It is disclosed solely for use by qualified technicians for purposes of equipment maintenance and service. It is not to be disclosed to others without the expressed permission of Fender Musical Instruments Co. All specifications subject to change without notice.

For warranty repair service, only Fender specified part numbers are to be used. It is recommended they also be used for post-warranty maintenance and repair.

Parts marked with an asterisk (*) indicate the required use of that specific part. This is necessary for RELIABILITY and SAFETY requirements. **DO NOT USE A SUBSTITUTE!**

A coded naming convention is used in the description of certain parts. The codes and what they mean are as follows:

CAPACITOR CODES		HARDWARE CODES	
CAP AE	= Aluminum Electrolytic	BLX	= Black Oxide
CAP CA	= Ceramic Axial	CR	= Chrome Plated
CAP CD	= Ceramic Disk	HWH	= Hex Washer Head
CAP MPF	= Metalized Polyester Film	M	= Machine Screw
CAP MY	= Mylar	NI	= Nickel Plated
CAP PFF	= Polyester Film/Foil	OHP	= Oval Head Phillips
		PB	= Particle Board
		PHP	= Pan Head Phillips
		PHPS	= Pan Head Phillips Sems
		SMA	= Sheet Metal "A" Point
		SMB	= Sheet Metal "B" Point
		SS	= Stainless Steel
		TF	= Thread Forming
		ZI	= Zinc Plated

RESISTOR CODES

RES CC	= Carbon Comp
RES CF	= Carbon Film
RES FP	= Flame Proof
RES MF	= Metal Film
RES WW	= Wire Wound

SPECIFICATIONS

Type: PR 189

POWER AMPLIFIER SECTION:

Power output: 520 Watts R.M.S. @ 2 Ohms
350 Watts R.M.S. @ 4 Ohms

Distortion at 520 watts: Less than .2% @ 1 kHz into 2 Ohms

Minimum load impedance: 2 Ohms

Sensitivity: 1.28V R.M.S.

Input impedance: 22K ohm

DELTACOMP range: 20 dB

PREAMP SECTION:

Input impedance: LOW-Z 1.82k
HI-Z 18.2k

Hi-Z Input Sensitivity for 520 watts: 55 mV
(MAIN MASTER and CHANNEL
Main at maximum, all tone controls
and GEQ at "0" detent).

Channel tone controls: LOW +/- 15 dB at 100 Hz
MID +/- 15 dB at 750 Hz
HIGH +/- 15 dB at 10 kHz

Graphic equalizer: +/- 12 dB at 63, 125, 250, 500, 1k,
2k, 4k, 8k, and 16kHz.

Dimensions:

	SR 6520PD	SR 8520PD
Height:	10-7/16 inches (26.5 cm)	10-7/16 inches (26.5 cm)
Width:	23-5/8 inches (60.0 cm)	27-5/8 inches (70.2 cm)
Depth:	12 inches (30.5 cm)	12 inches (30.5 cm)
Weight:	40.0 lbs. (18.2 kg)	42 lbs. (19.1 kg)

POWER AMPLIFIER: The signal from the preamp feeds from P1B pin 4, through a ribbon cable, to P1A on the power amplifier PCB. The signal couples (via C1) to the unity gain amplifier U1B. U1B contains a closed loop (gain of 1) negative feedback path, along with positive feedback through the inverting Operational Transconductance Amplifier (OTA) U2. U1B and U2 make up the gain reduction circuit for the DELTACOMP™ clip protection feature.

The attack and release circuit for the DELTACOMP™ is made up by the Diode, Resistor, and Capacitor network which drives the Base of Q29. Comparator U1A senses the voltage from the Collectors of Q27 & Q28. When the power amplifier approaches clipping on a positive swing, the collector of Q9 pulls up R50, which turns on Q28, transferring -15vdc to the collector, pulling down R52. This causes the output (pin 1) of U1A to switch from +15vdc to -15vdc, lighting the DELTACOMP™/Clip Led. Note when the DELTACOMP™ is disabled, the Led indicates clipping of the output stage. With the DELTACOMP™ enabled, the Led indicates an active DELTACOMP™ circuit. The negative control voltage from R52 also feeds through P1A to P1B on the preamp PCB. The voltage is routed to the DELTACOMP™ switch (S1), located on the front panel. With the switch engaged, the control voltage is sent back through the ribbon cable (via P1 pin 6) to the attack/release circuit.

The negative voltage drives through Diodes CR34 - CR37, and charges Capacitors C26-C29 all at once in parallel as a one pole filter through a single time constant of R52 X (C26+27+28+29) or 3.9K X 8.8μF = 34.3ms. As they charge, Q29 turns on and provides current to pin 5 of the OTA (U2). The current controls the output amplitude of U2. The inverted signal from U2 mixes with the input to U1B providing cancellation which reduces the input to the power amplifier. This prevents the amplifier from clipping. When the output of the power amplifier is reduced, the output of U1A toggles back to +15vdc. Due to the blocking action of Diodes CR34 - CR37, Capacitors C26-C29 are forced to discharge as a 4-pole filter with different time constants through R58. R62 prevents Parasitic oscillation while Zener CR38 provides 2 slopes which results in smoother limiting.

When the power amplifier approaches clipping on a negative swing, R46 is pulled low, turning on Q26 which pulls up the Base of Q27 transferring -15 vdc to the collector.

JFET Q1 and associated components provide a 4-5 second turn-on delay for the audio input to the power amplifier. When the power is switched on, Capacitor C3 charges through Resistor R4. The negative Gate voltage pinches off the JFET, removing the ground from the input of the amplifier. When the power is switched off, C3 immediately discharges through Diode CR1, grounding the input of the amplifier.

TROUBLESHOOTING TIP: Check for proper operation of this circuit when experiencing excessive turn-on or turn off "Pops", or no output when signal applied to the input. Many times the JFET itself can be the culprit. **NOTE:** Excessive turn-off "Pops" can also be caused by uneven discharge of the +/- power supplies. Usually a mismatch in the Filter Capacitors will cause this problem. Its easy to look at both supplies on an oscilloscope. Invert one scope input and check for even discharge to zero volts.

Q4 is the current source for the Differential Amplifier (Q2, Q3). For the Diff amp to work properly, one half of the current from the current source must flow through each leg of the Diff amp. If the same amount of current flows through each leg of the Diff amp, the voltage drop across resistors R12 & R13 must be the same. If not, there will be a DC offset at the output of the amplifier. The overall gain of the amplifier is set up around the Diff amp. R15 (27K) is the feedback resistor and R14 (1K) is the pull-down resistor. $R_{fb} + R_{pd} / R_{pd} = A_v$. Therefore $27K + 1K / 1K = 28K / 1K = 28 A_v$.

CIRCUIT DESCRIPTION Cont.

PARTS LIST

NOTE: SHADED ITEMS ARE FOR REFERENCE ONLY

Q7 & Q11 make up a voltage amplification stage. Again, to operate properly, the same amount of current must flow through these transistors. Thus the voltage drop across R21 & R22 must be the same.

Adjustable bias is provided by Q8 & its associated components. 1.2volts is provided to the Base of Driver Transistors Q14 & Q15, and -1.2 volts is provided to the base of the Driver Transistors. This provides + or - 0.6 volts to the bases of the output transistors (Q18-Q25) in parallel, biasing them on.

Transistors Q12, Q13, and associated components comprise the Current Limiting or Short Proof protection circuit. There are usually two conditions which demand excessive output current from the amplifier. A shorted speaker cable, or a load impedance which is below the minimum rating of the amplifier. If these conditions occur, the voltage drop across the Emitter Resistors (.33Ω 5 Watt) will dramatically increase. On the positive side of the amplifier, C11 charges through R25 & R27. On the negative side C12 charges through R31 & R32. This will cause Q12 & Q13 to turn on. This limits the amount of signal which is available to the Base of the Driver Transistors (Q14 - Q17).

DIFFERENCES IN VERSIONS: In all versions (SR6520/8520, SR6520P/8520P, & SR6520PD/8520PD) the power amp remained unchanged; normal schematic revisions were not related to version changes. The "P" version added Phantom power, which caused the preamp PCB assy to change by adding traces to carry phantom power to the XLR microphone connectors, and added a +15V regulator circuit to the preamp PCB assy in order to provide the phantom power. The "PD" version added digital effects (PCB assy 041875) and a ribbon cable to connect the PCB's together (P2 to P3), along with some obvious cosmetic changes

WARRANTY PHILOSOPHY ON DIGITAL REVERB MODULE: Replacement, rather than repair of the 041092 module is the recommended warranty procedure for failures of the module.

NOTICE:
Reference designators 100-199 refer to and are listed only for channel 1. Channel 2 designators are 200-299 etc. Part quantities are listed only for the SR-6520PD (6 channel version).

NOTES: UNLESS OTHERWISE SPECIFIED.

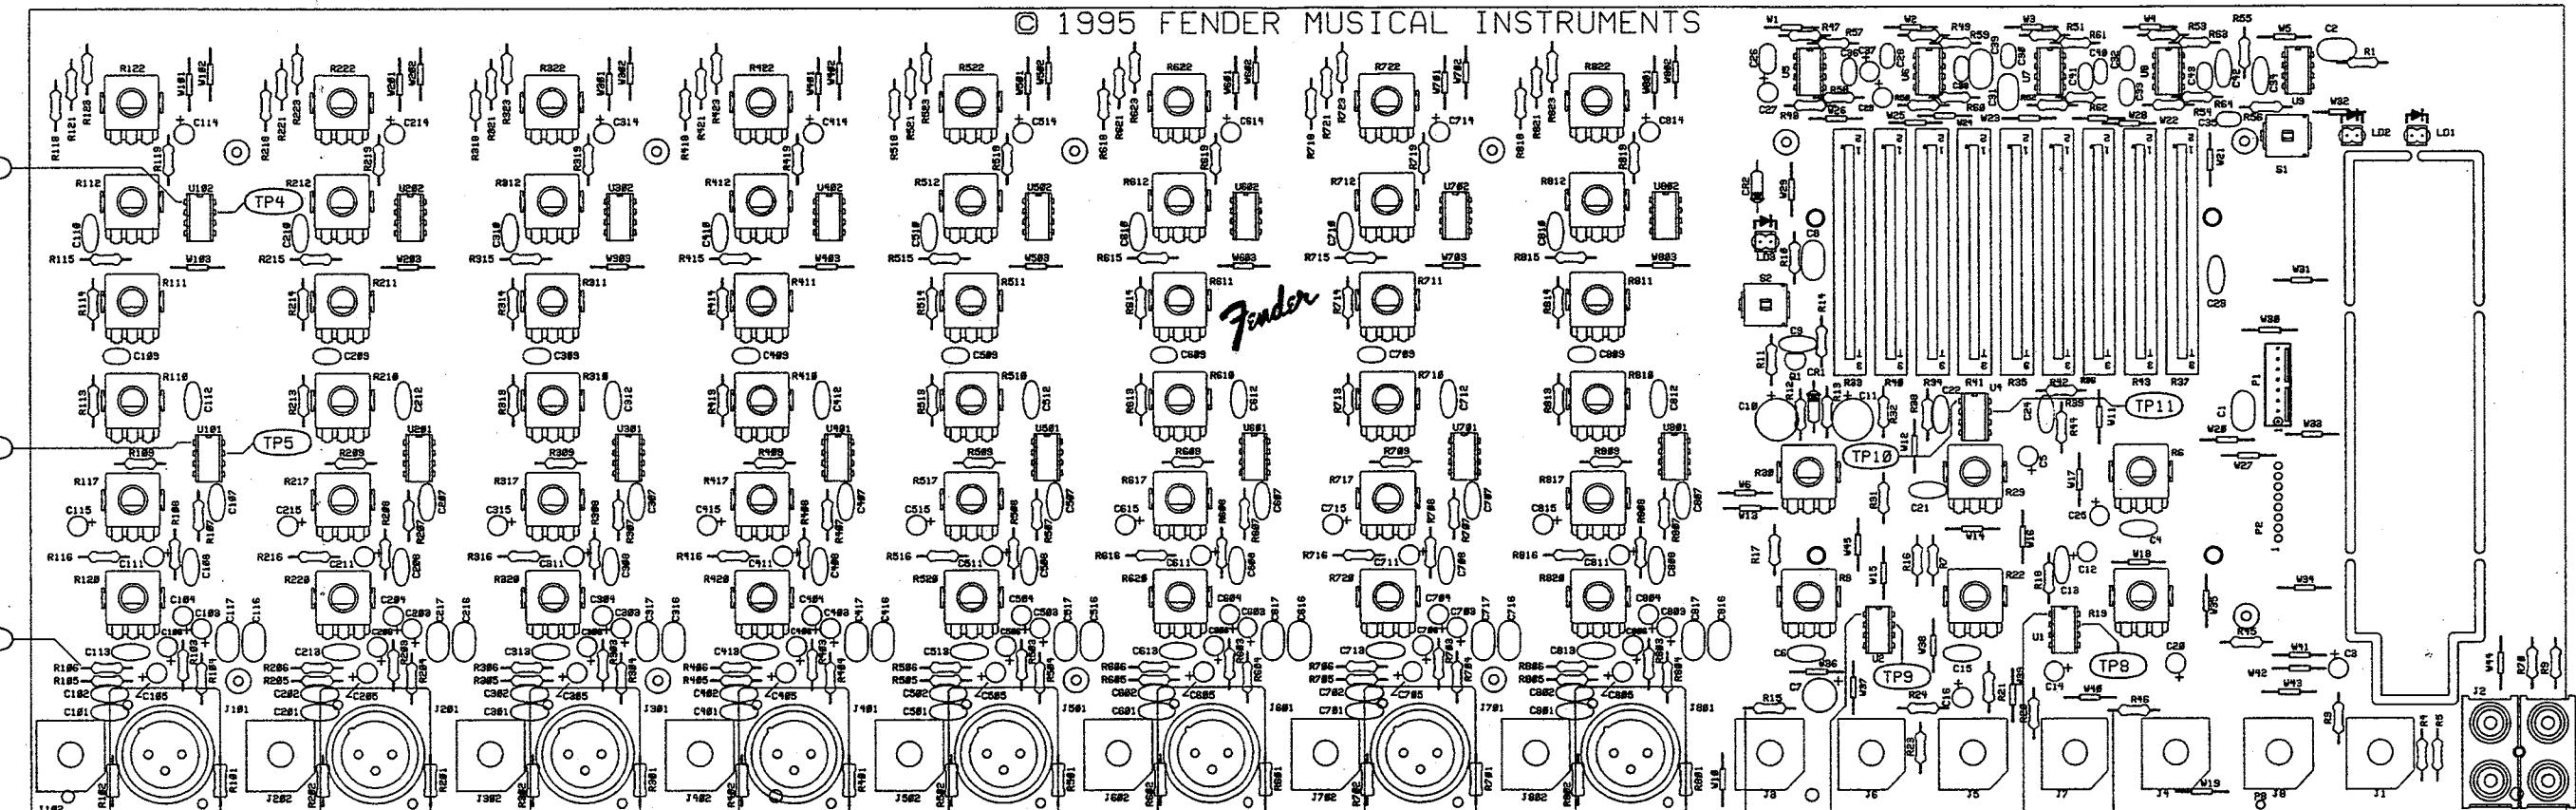

1. ALL VOLTAGES READ TO GROUND WITH A D.V.M.
UNDER THE FOLLOWING CONDITIONS:
 - 1.1 GRAPHIC EQUALIZER, LOW, MID, AND HIGH FREQUENCY
CONTROLS AT CENTER TRAVEL / ROTATION.
 - 1.2 MAIN AND MONITOR REVERB AT MINIMUM.
 - 1.3 ALL OTHER CONTROLS AT MAXIMUM.
 - 1.4 A 1KHZ, UNBALANCED INPUT AT J102.
 2. ALL RESISTORS $\frac{1}{4}$ W, $\pm 5\%$
 3. ALL CAPACITORS 63 VOLT MINIMUM.
 4. LAST INSTANCE:
C43, CP1, CR2, J8, LD3, P5, R64, S2, U
 5. CIRCUITRY WITHIN DASHED LINES
IS IDENTICAL FOR EACH CHANNEL.
 6. INSTANCE NAMES IN EACH CHANNEL ARE
KEYED TO THE CHANNEL NUMBERS.
