## Electronics and the metric system

Australia is now well on the way to using metric units for all forms of measurements. It is important, therefore, that we not only now use metric units exclusively, but that we also express these units in accordance with accepted standards. This article is intended to guide those in the electronics industry on the correct use of metric units.

by PETER O'NEILL. B.E. (Hons.)

> Senior Adviser, Metric Conversion Board:

The International System of Units (SI) is the most modern system of units of measurement available in the world today. Almost every country either uses this system or is committed to its use. Australia, by virtue of the Metric Conversion Act of 1970, is converting to SI and it is expected that this will be its sole system of measurement (with a few exceptions) by 1980. Already much of industry is converted.

Unfortunately there are some who do not know, or do not apply, the rules. Microfarad, to quote one example, can be seen presented as mf, mfd,  $\mu$ f,  $\mu$ F,  $\mu$ and u. Only one is correct (µF) and only one should be used to provide ease of reading and recognition and to prevent

To help all those involved in specifying or describing electronic circuitry and components the following notes are provided to show how units should be stated. In addition, a selection of commonly used units and typical applications has been compiled.

Correct presentation of metric units The following points should be noted

when using metric units.

 Instead of using a comma to denote a thousand in numbers leave a space between each group of three digits: 3 000 000 NOT 3,000,000

Numbers with four digits may be written with or without a space: 4200 or 4 200. Except in tables, the former is preferred.

A thin space should be left between number and unit symbol: 20 A NOT 20A

An exception is when expressing temperature:

25°C NOT 25 °C

All unit names and prefixes are written in small letters and without initial capitals. The degree Celsius is the only exception: metre, watt, volt NOT Metre, Watt, Volt.

m (metre), g (gram), s (second) except those derived from proper names: H (henry), Hz (hertz), V (volt), °C (degree Celsius) and the symbols for the prefixes: M (mega), G (giga), T (tera), and L for litre thus metre (m), volt (V), megawatt (MW), millilitre (mL) metre (M), volt (v), megawatt (mW),

All symbols use small letters:

Some symbols derived from proper names incorporate two letters to distinguish them from other symbols: thus Hz (hertz), H (henry) Wb (weber), W (watt) The second letter so used is lower

Hz, Wb NOT HZ, WB but F (farad), A (ampere) NOT Fd, Amp

millilitre (ML)

- The prefix symbol is attached directly to the units symbol and a space or dot is not used between them: mm NOT m.m.; kg NOT k g
- The prefix symbol should always be accompanied by the symbol on which it operates: μF NOT μ; kΩ NOT k NOR K
- A prefix symbol should not be attached to a unit name: µWb NOT µweber
- Full stops are not used following unit symbols except at the end of a sentence
- e.g. kg, mm etc NOT kg., mm., etc.
- The product of two units in compound symbols is indicated by a dot

A.h, kW.h NOT Ah, kWh

The correct pronunciation of kilometre is 'kill-o-metre' not 'k'lom-etre'.

The Metric Conversion Board would be pleased to check any draft material before publication or use to ensure that metric usage is correct.

Alternative symbols

In some typesetting systems, some symbols may be unavailable. In such cases, the following alternative symbols should be used:

micro	u
square millimetre	sq mm
cubic centimetre	cu cm
cubic metre	cu m
revolution per minute degree Celsius	rpm
	·
ohm	ohm
kilohm	kilohm
megohm	megohm

## Prefixes

A prefix is attached to a unit to indicate a multiple or sub-multiple of the

milliwatt is one thousandth of a watt kilowatt is one thousand watts

Prefixes likely to be encountered include:

Prefix	Symbol	Meaning
giga	G	10°
mega	M	106
kilo	k	103
milli	m	10-3
micro	μ	10⁻⁴
nano	'n	·10·9
pico	р	10-12

'giga' is pronounced with a hard 'g' as in 'give'.

Rounding

THE STATE OF THE PROPERTY OF T

If conversion of imperial quantities is necessary, try not to make the metric numbers any more precise than the original numbers. If the existing number is a rounded 10 inch, then a rounded 250 millimetres is usually accurate enough, rather than 254 mm. Decimal places should be avoided unless they are significant.
