

CONNECTIONS

The Kustom IV Bass dual power amplifier output section must be connected to the proper speaker cabinets for optimum operation. Two output jacks are provided for both output stages. All four jacks are used **only** when four 8.0 ohm speaker cabinets are employed. No standard Kustom speaker cabinets in this impedance range are offered.

When using a single cabinet (4-12" speakers with two jacks), two speaker cables are required. Plug one cable in the top left jack and the other cable in the bottom right jack.

When using a dual cabinet configuration (4-12" speakers with single jack in each cabinet), two speaker cables are required. Plug one cable into the top left jack and the other cable into the bottom right jack.

A good rule is: Do not plug more than one Kustom speaker cabinet into a set of jacks in the amplifier. If the amplifier is accidentally overloaded, it will thermal cycle, but no permanent damage will result.
