

Fender®

PASSPORT® P-80

(This is the model name for warranty claims)

p/n 069-1003-000

SERVICE MANUAL

ATTENTION:
WARRANTY SERVICE PROCEDURES

Warranty field service of the Passport® P-80 will be limited to replacement of defective PCB Assemblies and all other parts not marked as “REF” in the Parts List. **Non-Warranty** repairs can of course be to the component level at the Service Center’s discretion. For **non-warranty** component level repairs all parts listed as “REF” in the Parts List must be sourced from suppliers other than FMIC.

October, 2007

It is not to be sold or assigned to another party and is disclosed solely for use by Fender Authorized Service Centers for purposes of product service and maintenance. All information is not to be disclosed to others without the expressed permission of Fender® Musical Instruments Corporation. All

specifications are subject to change without notice. This information and any copies produced electronically or otherwise must be surrendered upon demand of Fender® Musical Instruments Corporation.

- Parts marked with two asterisks (**) indicate the required use of that specific part. This is necessary for RELIABILITY and SAFETY requirements.
DO NOT USE A SUBSTITUTE!

PARTS LIST CODES

The description codes used in the itemized Parts Lists are defined below:

CAPACITOR CODES

CAP AE	= Aluminum Electrolytic
CAP CA	= Ceramic Axial
CAP CD	= Ceramic Disk
CAP CR	= Ceramic Radial
CAP MPF	= Metalized Polyester Film
CAP MY	= Mylar
CAP PFF	= Polyester Film/Foil

RESISTOR CODES

RES CC	= Carbon Comp
RES CF	= Carbon Film
RES FP	= Flame Proof
RES MF	= Metal Film
RES MOX	= Metal Oxide
RES WW	= Wire Wound

HARDWARE CODES

BLX	= Black Oxide
CR	= Chrome Plated
HWH	= Hex Washer Head
M	= Machine Screw
NI	= Nickel Plated
OHP	= Oval Head Phillips
PB	= Particle Board
PHP	= Pan Head Phillips
PHPS	= Pan Head Phillips Sems
SMA	= Sheet Metal "A" Point
SMB	= Sheet Metal "B" Point
SS	= Stainless Steel
TF	= Thread Forming
ZI	= Zinc Plated

SPECIFICATIONS

Model Name:	PASSPORT P-80
Release Number:	PR600
Part Number:	(120V, 60Hz) US: 069-1003-000 (240V, 50 Hz) AUS: 069-1003-030 (230V, 50 Hz) UK: 069-1003-040 (230V, 50 Hz) EUR: 069-1003-060 (100V, 50 Hz) JPN: 069-1003-070
Frequency Response:	20 Hz to 40 kHz ± 1 dB (at send output) 30 Hz to 30 kHz ± 1 dB (at speaker output, with processor threshold exceeded)
Distortion:	< 0.1%, 20 Hz to 20 kHz, 1dB below rated output
Signal to Noise Ratio:	> 80 dB @ 1W, "A" WTD
Power Output:	80W continuous average power, 4Ω, both channels driven with THD < 1%
Input Impedance:	"Mic" switch position: 2 kΩ "Line" switch position: 66 kΩ 78 kΩ (Channels 1-2-3 XLR and 1/4") (Phono Channel 1/4")
Max. Input Level:	Mic: -7 dBu Line: 30 dBu Stereo: 26 dBu
Return Input Impedance:	47kΩ
Fuse type:	T4AH, 250V
Passport System:	Width: 610 mm (24 in.) Height: 541 mm (18 in.) Depth: 254 mm (10 in.) Weight: 11.83 kgs (26 lbs)
Speakers:	Width: 245 mm (9.65 in.) Height: 439 mm (17.5 in.) Depth: 241 mm (9.5 in.) Weight: 3.3 kgs (7.25 lbs)
Power Tower:	Width: 254 mm (10 in.) Height: 451 mm (18 in.) Depth: 178 mm (7 in.) Weight: 5.23 kgs (11.5 lbs)
Tower Footprint:	241 x 298 mm (9.5 x 11.75 in.)
Microphone:	Dynamic Cardioid, balanced
Microphone Cable:	XL-Male to XL-Female, 6 m (20 feet)
Speaker Cables:	1/4 in. to 1/4 in., 9 m (30 feet)

0 dBu is referenced to 0.775 volts rms

Product specifications are subject to change without notice

SERVICE NOTES

The following describes the procedure to dismantle the P-80 Cabinets.

STEP A: P-80 CABINETS

- A1. Unscrew four M4 machine screws on each side of the left and right hatches.
- A2. Unscrew two M3 pan-head machine screws on the handle cover and detach it.
- A3. Place the unit upside down. Unscrew eight M4 self-tapping screws off the foot standers.
- A4. Detach the foot standers. There are six M3 self-tapping screws in the middle portion.
- A5. Unscrew three M3 self-tapping screws located on the right-hand-side.
- A6. Place the unit in the normal position.
- A7. Locate the four M3 and two M4 self-tapping screws on the top and unscrew them.
- A8. Separate the left and right cabinets.
- A9. Locate the UHF and VHF antennas on the right and left cabinets respectively.
- A10. De-solder both antennas.
- A11. Unscrew three M3 self-tapping screws on left and right side panels of the tower metal assembly.
- A12. Unscrew eight M2.6 and six M3 self-tapping screws.
- A13. Detach the left and right metal side panels.
- A14. Detach the 8-pin antenna connector.
- A15. Detach the top metal cover.
- A16. Unscrew seven M3 self-tapping screw on the rear panel
- A17. Detach all connectors.
- A18. The procedure is completed.

STEP B: P-80 MIXER PCB

- B1. Detach 14 knobs and their nuts.
- B2. Detach the Reverb PCB assembly.

- B3. Unscrew nine M3 machine screws from the mixer PCB assembly.
- B4. Detach all connectors.
- B5. The procedure is completed.

STEP C: P-80 DSP REVERB PCB

- C1. Detach all connectors.
- C2. The procedure is completed.

STEP D: P-80 INPUT PCB

- D1. Unscrew six screws and nuts from the front panel.
- D2. Detach all connectors.
- D3. The procedure is completed.

STEP E: P-80 POWER AMP PCB

- E1. Unscrew four screws connecting the heatsink to the side brackets (two on either side of tower).
- E2. Detach all connectors.
- E3. The procedure is completed.

STEP F: P-80 SMPS PCB

- F1. Unscrew three screws from the front panel.
- F2. Detach all wiring and connectors.
- F3. Unscrew six screws from the top cabinet of the SMPS.
- F4. Unscrew three screws from the bottom cabinets of the SMPS.
- F5. Detach the spacer from the wiring of the SMPS.
- F6. Unscrew the earthing M4 nut.
- F7. Detach the mains connector from the AC inlet.
- F8. Unscrew five screws from the SMPS PCB assembly
- F9. The procedure is completed.

PCB EXCHANGE POLICY

Parts marked with a single asterisk (*) in the Part Lists are not field replaceable. If a failure due to one of these components is detected, please con-

tact the FMIC Customer Service Department to order the complete PCB Assembly.

CIRCUIT DESCRIPTION

This section provides concise information about new or unusual circuitry designs incorporated into this amplifier model. The purpose is to aid the service technician by providing insight into the design areas most likely to become obstacles in troubleshooting. Information is focused for its effective use while maintaining the security of Fender® proprietary information wherever possible.

The P-80 consists of the following modules.

1. Mixer Section
2. Digital Reverb Section
3. Signal Processor Circuit and System EQ Circuit
4. Power Amplifier
5. Switch Mode Power Supply Unit (SMPSU)

Mixer Section

The mixer section is mainly made up of operational amplifiers as gain stages and therefore a technical description will not be used here. Following is a basic circuit description to familiarize you with the layout of the circuit.

The Mic/line section is made up of 3 microphone / line inputs each with a first stage preamplifier for balanced or unbalanced inputs (locate on the mixer board). Line inputs can operate as either balanced or unbalanced if TRS or TR 1/4" jacks are used respectively. Gain selection of 1dB/+30dB is made by switching a different value resistor in the input stage. At this point on channel one, the signal is picked off for the VIP control ducking circuit made up of U1B. After the input stage there is one knob for contour control, followed by an auto-pad level control where the signal splits off into the rev/aux bus and main signals with the main signals going to a pan circuit. Here the main signal is split between

left and right channel signal bus. Channel three also has an additional input via a pair of RCA connectors where the signals are summed into mono which may be used as an auxiliary audio signal input. This circuit consists of an auto-pad level control, low frequency and high frequency tone controls, and a rev/aux send control.

The audio bus is connected to three FETs that perform ducking of the signals on the bus with the exception of channel one which is the drive circuit for the VIP ducking circuit. This function is provided by U1B.

Bus signals are buffered by U8A and drive the tape out connections and the main master level control circuitry made up of U9A. Rev/Aux signals are buffered by U12B and feed the mono aux send output. The main level control is auto-pad configured and drives the speaker EQ circuitry made up of U10A. Note: Channel 1 Mic/Line reverb function will be affected by VIP control making announcements on Channel 1 dry.

The mixer board also contains part of the signal processor circuit and the system EQ circuit for the power amplifier. These circuits are an integral part of the power amplifier and appear after the return signal path.

These circuits will all be discussed later in this document.

Digital Reverb Section

The DSP Reverb PCB module receives the input REV/AUX signals at pin 4 of connector CN401. The

(This is the model name for warranty claims)

DSP Reverb's IC's consist of U404 (AL1101 ADC), U405 (AL1201 DAC), and U406 (AL3201B). The outputs from U405 are fed to U402B and then buffered by U402A before feeding back to pin 6 of CN 401.

Signal Processor Circuit and System EQ Circuit

The signal processor is partially located on the mixer board but is an integral part of the power amplifier section. The operation of this circuit is performed by filtering the signal from U11A which drives the bases of Q5 and Q7 to control the voltage level at FETs Q4 and Q6 respectively. This in turn changes the filter characteristics of circuits which at low levels boosts the low and high frequencies of the signal. At high signal levels with the gate voltages approaching or at 0v, the circuit lowers the boost of the low frequencies in response. This circuit is post aux return and therefore does not modify the response of the signal at the aux send outputs.

Power Amplifier

Note: In cases where the amplifier circuits are identical between the left and right channel. Only components related to the left channel will be discussed for simplicity.

The first stage of the power amplifier is made up of op amp U201A that acts as the input buffer and muting circuit for minimization of turn on/off pops. Q202 in balance with the input resistors of this circuit are designed to provide a deep muting effect. This circuit will be called into action if the temperature of the heat sink also rises above 80 degrees Centigrade. (Typical HS temperature is around 50 for normal operation). The output of the first stage feed trimmer resistor VR201 which are part of the balanced input section of low noise op-amp U203A which sets the amplifier gain (factory set at approximately 30.5dB). The output of the second stage directly drives the biased gates of lateral power FETs Q205 and Q208.

Speaker short circuit protection is provided by U203B. This is accomplished when the output is shorted to ground, the normal differential signal applied to U203B is absent at the negative terminal while at the same time, the second stage is now forced into open loop gain. The drive signal is integrated into C211 forcing a positive voltage at the output of U203B that pulls the gate of FET Q207 into conduction from its previous negative bias off point, nulling the output of U203A. With the output of U203A minimized the output current of the amplifier is minimized until the short is removed. At this time, C211 will discharge allowing normal operation of the amplifier. **Note:** Some small DC offset will be present when the amplifier is in the short circuit protect mode.

The power amplifier board also provides the ±15v for the mixer/reverb boards as well as the supply for the SMPSU FAN and the LED PCB which indicated power. The power amplifier board is also connected to the GM type fuse holder and aux DC power input connector.

Switch Mode Power Supply Unit (SMPSU)

This unit is not recommended to be serviced in the field except by replacing the complete module as a total assembly.

The following information is provided to assist in the trouble shooting of the unit. Please note that the mains fuse must be replaced with exactly the same grade of fuse for safety regulations and to avoid risk of damage and potential fire hazard.

The mains input to the SMPSU allows for operation from 100V to 240V. The output of the SMPSU is ±36V DC for the main power supply rails of the power amplifier. The unit also has connectors for mains power input, mains power switch and chassis, earth and signal grounds.

Service Tip: You can connect to the aux DC input (with GM fuses installed) to test the output voltage to the rails before you open the set for service to get an indication of a possible power supply fault as it is connected to the rail output. Do not short these terminals!

(This is the model name for warranty claims)

The SMPSU incorporates protection circuits other than the fuses including over current protection. All parts contained in the SMPSU should be considered to be safety parts and should be replaced with only exact where service can be provided by properly licensed and trained repair technicians. This includes the dust filter as well as it has a fire hazard rating. ***Please be aware that voltages contained in this module are deadly.***

Service Notes on Changes and Updates

Refer to the mixer schematic diagram of this manual for the following change. A 0.01uF mylar film capacitor has been added to the VIP ducking circuit to prevent a slight hum that may be heard as an artifact at the tail of the ducking action. This was mainly detected on UL voltage settings. This capacitor is added at the junction of R18 (1Mega ohm) and D16 and the Source (Ground) of FET Q3 (J112). This modification should be performed on individual units that are listed below by S/N. All other UL units have been modified by the factory.

PASSPORT® P-80
